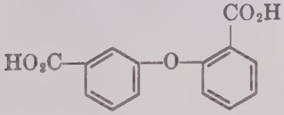
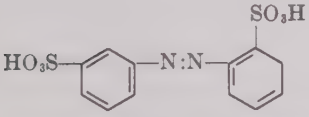
$C_6H_5C(OC_2H_5)_3$	**Orthobenzoic acid,** triethyl ester.

48. **Acids attached by a non-carbon link.** The following examples explain the usage of the Table where the same acid appears attached twice to a non-carbon atom:

$NH(CH_2CO_2H)_2$ **Acetic acid, iminodi-**



Benzoic acid, 2,3′-oxydi-



Benzenesulfonic acid, 2,3′-azodi-

If the acids are different the name of the compound may appear under one of them or under the name of the linking functions.

49. After the name of the parent-acid the particle **per-** is used; *e.g.:*

CH_3CO_3H **Acetic acid, per-**

50. **Organic acids other than carboxylic, sulfonic, sulfinic and sulfenic.** See IUC rule 34.

51. **Inorganic acids.** Their derivatives may appear either under the name of the acid or under the name of the organic base; *e.g.:*

$SO_2(OCH_3)_2$ **Sulfuric acid,** dimethyl ester
$C_6H_5NH_2.HNO_3$ **Aniline** nitrate.

52. **Isocyanides.** The prefix **isocyano-** is used for the substituent —NC; *e.g.:*

$C_6H_5—NC$ **Benzene, isocyano-**

53. **Anhydrides.**

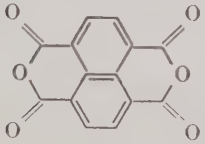
a) *Symmetrical anhydrides of monobasic acids.* After the name of the acid comes the word anhydride; *e.g.:*

$(CH_3CHBrCO)_2O$ **Propanoic acid, 2-bromo-,** anhydride.

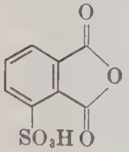
b) *Mixed anhydrides:* Both possible names appear (one of them as a cross-reference); *e.g.:*

$CH_3CHClCOOCOCH_2CH_2Cl$ **Propanoic acid, 2-chloro-,** anhydride with 3-chloropropanoic acid; and also:
Propanoic acid, 3-chloro-, anhydride with 2-chloropropanoic acid.

c) *Cyclic anhydrides of polyacids* are named by placing the word anhydride after the name of the acid; *e.g.:*



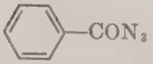
1,4,5,8-Naphthalenetetracarboxylic acid, 1:8,4:5-dianhydride



Phthalic acid, 3-sulfo-, anhydride.

54. **Acid halides and azides.** The name of the substituent of the hydroxyl group appears after the name of the corresponding acid; *e.g.:*

$CH_3CHClCOCl$ **Propanoic acid, 2-chloro-,** chloride

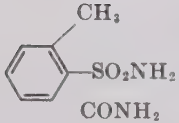


Benzoic acid, azide

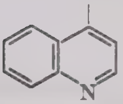
55. **Amides.**

a) *Primary amides* appear under the name of the corresponding acid followed by the word amide; *e.g.:*

CH_3CONH_2 **Acetic acid,** amide
(cross reference under **Acetamide**)

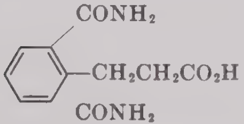


2-Toluenesulfonic acid, amide

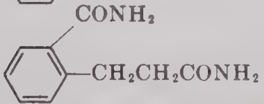


4-Quinolinecarboxylic acid, amide

Nevertheless, when in forming the name of the corresponding acid the particle **carboxy-** is used, and this group turns to an amide group, the prefix **carbamyl-** is used; *e.g.:*

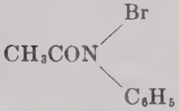


Propanoic acid, 3(2-carbamylphenyl)- (see paragraph 37),



Propanoic acid, 3(2-carbamylphenyl)-, amide

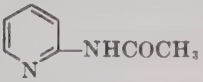
b) *N-Alkyl, N-Aryl and other N-derivatives of amides.* Substituents in the N atom appear in alphabetical order after the word amide; *e.g.:*



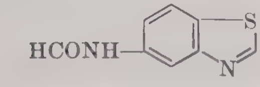
$CH_3CON(Br)(C_6H_5)$

Acetic acid, amide, *N*-bromo-*N*-phenyl-

Compounds with heterocyclic radicals attached to the *N*-atom of formamide, acetamide and benzamide are named with the heterocycle as parent compound using the particles **formamido-, acetamido-** and **benzamido;** *e.g.:*

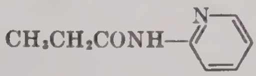


Pyridine, 2-acetamido-



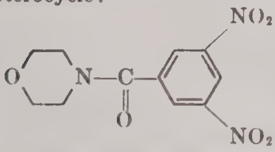
Benzothiazole, 5-formamido-

Derivatives of other amides follow the general rule stated above, *e.g.:*



Propanoic acid, amide, *N*(2-pyridyl)-

Amides in which the amide nitrogen is part of a heterocyclic system are named as acyl derivatives of that heterocycle:

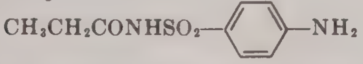


Morpholine, 4(3,5-dinitrobenzoyl)-

c) *Secondary and tertiary amides* are named according to the largest carboxylic acid from which it can be derived; *e.g.:*

$CH_3CONHCOCH_3$	**Acetic acid,** amide, *N*-acetyl- (cross reference under **Diacetamide**)
$C_6H_5CONHCOCH_3$	**Benzoic acid,** amide, *N*-acetyl-
$(C_6H_5CO)_3N$	**Benzoic acid,** amide, *N,N*-dibenzoyl- (cross reference under **Tribenzamide**)

A mixed amide of a carboxylic and a sulfonic acid is named as a derivative of the amide of the carboxylic acid *e.g.:*



Propanoic acid, amide, *N*(4-aminobenzenesulfonyl)-

d) *Amides of hydroxamic acids.* As in paragraph 52a.

56. **Polypeptides.** A small number of polypeptides appear in the Table. They are found under their trivial name, or under the name of the amino acid that retains its carboxylic group and shares its amino group; *e.g.:*

$CH_3CH(NH_2)CONHCH_2CONHCH_2CO_2H$

Glycine, *N*(***N*-alanylglycyl)-**

57. **Hydrazides of acids.** See paragraph 110.

58. **Esters.** After the name of the corresponding acid comes the radical and the word ester; *e.g.:*

$C_6H_5COOC_6H_5$	**Benzoic acid,** phenyl ester
$HOSO_2OCH_3$	**Sulfuric acid,** monomethyl ester

Nevertheless, esters of complicated and polyvalent alcohols may appear under the name of the alcohol; *e.g.:*

 $\begin{array}{l} CH_2O_2C(CH_2)_{15}CH_3 \\ \vert \\ CHO_2C(CH_2)_{15}CH_3 \\ \vert \\ CH_2O_2C(CH_2)_{15}CH_3 \end{array}$	**Glycerol,** triheptadecenoate
	**Menthol,** acetate
	**Aspirin,** *see* **Benzoic acid, 2-hydroxy-,** acetate

59. **Orthoesters.** See paragraph 47.

60. **Amidoximes** are treated as amides of hydroxamic acid (see paragraphs 41, 55).

61. **Amidines.** After the name of the corresponding acid the word **amidine** appears; *e.g.:*

$CH_3(CH_2)_6C(:NH)NH_2$	**Octanoic acid,** amidine

The nitrogen atom of the —NH_2 group is designated *N* and that of the =NH group *N'*. If a nitrogen atom of the amidine function is a part of a ring the compound is named according to the heterocyclic system.

62. **Betaines.** See paragraph 35.

63. **Lactams and lactones.** If there is no name for the ring system of the compound, the word lactam or lactone appears after the name of the corresponding aminoacid or hydroxyacid; *e.g.:*

	**Hexanoic acid, 5-amino-,** lactam, *see* **2-Piperidone, 6-methyl-**

64. **Nitriles.** After the name of the corresponding acid the word nitrile appears; *e.g.:*

$CH_3CH(NH_2)CN$	**Alanine,** nitrile
	**2-Naphthoic acid,** nitrile
$CH_3(CH_2)_5CN$	**Heptanoic acid,** nitrile
$NCCH_2CO_2H$	**Malonic acid,** mononitrile (cross-reference under **Cyanoacetic acid**)

If the group —CN comes instead of a —CO_2H group that is designated as **carboxy-,** the particle **cyano-** is used; *e.g.:*

	**Propanoic acid, 3(2-cyanophenyl)-**

65. **Imides.** The word imide appears after the name of the corresponding dicarboxylic acid:

	**Phthalic acid,** imide (cross-reference under **Phthalimide**)
	**Succinic acid, 2-methyl-,** imide, *N*-bromo-

For imides of monobasic acids see paragraph 55c.

66. **Cyanates, isocyanates, thiocyanates and isothiocyanates,** appear under the headings **Cyanic acid, Ioscyanic acid, Thiocyanic acid** and **Isothiocyanic acid** respectively, or, when the radical attached to these groups is complicated, the compound appears under the name of the corresponding alcohol (these rules are identical to those given for esters, amides, etc. in paragraphs 58, ff.).

ALDEHYDES

67. Geneva names for saturated and unsaturated aliphatic mono- and di-aldehydes are formed by dropping the final **e** of the name of the hydrocarbon and adding -al or (without dropping the **e**) **-dial.** The largest chain having the aldehydic group (or groups) as terminals is chosen.

Examples:

$CH_3(CH_2)_9CHO$	**Hendecanal**
$\overset{5}{C}H_3\overset{4}{C}H_2\overset{3}{C}H{:}\overset{2}{C}H\overset{1}{C}HO$	**2-Pentenal**
$OCHCH_2CH{:}CHCH{:}CHCH_2CHO$	**3,5-Octadienedial**

Some trivial names are used whenever the trivial name of the corresponding acid is used, *e.g.:* **formaldehyde, acetaldehyde, benzaldehyde, 1- and 2-naphthaldehyde, cinnamaldehyde,** etc.

When the **-carboxylic acid** nomenclature is used for the corresponding acid (see paragraphs 37, 39), the name of the aldehyde is formed by the use of the suffix **-carboxaldehyde;** *e.g.:*

	**1-Cyclohexenecarboxaldehyde**
	**1,4-Benzenedicarboxaldehyde**
$OCH(CH_2)_4CH(CHO)_2$	**1,1,5-Pentanetricarboxaldehyde**

When a function of higher rank (see paragraph 32) appears in the molecule the —CHO group is designated as **oxo-** or as **formyl-** as the case demands; *e.g.:*

	**Benzoic acid, 4-formyl-**
$OCHCH_2CH_2CO_2H$	**Butanoic acid, 4-oxo-**
 $CH_3CH_2CH_2\underset{CHO}{CH}CH_2CO_2H$	**Hexanoic acid, 3-formyl-**

68. **Acetals, hemiacetals and hydrates of aldehydes or ketones** appear in the Table immediately after the corresponding aldehyde or ketone. The following examples illustrate the nomenclature:

$CH_3CH_2CH(OC_2H_5)$	**Propanal,** diethyl acetal
$CH_3CH_2CH(OCH_3)OH$	**Propanal,** methyl hemiacetal
$Cl_3CCH(OH)_2$	**Acetaldehyde, trichloro-,** hydrate

69. **Thioaldehydes** are named by using the particles **-thial, -carbothialdehyde, thioformyl-** or **thioxo-** corresponding to the oxygen analogs (see paragraph 67). If the corresponding aldehydes appear under trivial names, the particle **thio-** is used; *e.g.:*

CH_3CHS	**Acetaldehyde, thio-**
CH_3CH_2CHS	**Propanethial**
	**3-Pyridinecarbothialdehyde**
	**Benzoic acid, 2-thioformyl-**
$SCHCH_2CO_2H$	**Propanoic acid, 3-thioxo-**

70. **Azines.** See paragraph 109.

71. **Imines.** See paragraph 99.

72. **Oximes.** The word oxime appears after the name of the corresponding aldehyde (or ketone).

KETONES

73. Ketones with no ring attached directly to the carbonyl group are named according to IUC rule 27.

74. Ketones with one aromatic ring attached to the carbonyl group are named according to IUC rule 27; *e.g.:*

	**2-Buten-1-one, 1(2,4-dimethylphenyl)-3-methyl-**
$CH_3CH_2COC_6H_5$	**1-Propanone, 1-phenyl-** (cross-reference under **Propiophenone**)

The following are exceptions:

$C_6H_5COCH_3$	**Acetophenone**
$C_6H_5CH{:}CHCOC_6H_5$	**Chalcone**
$C_6H_5COC_6H_5$	**Benzophenone.**

75. Monoketones with two rings attached to both sides of the carbonyl group appear under the heading **Ketone,** followed by the two rings in alphabetical order and then followed by the substituents in the rings (see paragraph 25); *e.g.:*

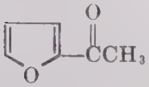
 3 2 1 1′ 8′ 7′ CH₃— —C— O 3′ —CH₃ 5′ Cl 5 8 7 CH₃	**Ketone, 1,2′-dinaphthyl, 4′-chloro-4,6,6′-trimethyl-**
 CH₃ 4′ 3′ O 2′ 2 3 1 CH₃— N —C— 4 1′ 6 5 H F	**Ketone, cyclohexyl 2-pyrryl, 3,5′-dimethyl-5-fluoro-**

Exception:

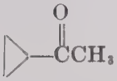
$C_6H_5COC_6H_5$	**Benzophenone**

EXPLANATION OF TABLE (Continued)

76. Acetyl derivatives of cyclic compounds other than acetophenone are named according to the name of the cyclic compound:



Furan, 2-acetyl-



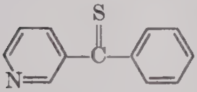
Cyclopropane, acetyl-

77. **Acetals, hemiacetals and hydrates of ketones.** See paragraph 68.

78. **Thiones** (**thioketones**) follow the Geneva system and IUC rule 27. When the corresponding ketone was given a trivial name the thione has the same name followed by the particle **thio-;** *e.g.:*

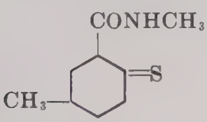
$C_6H_5CSCH_3$ **Acetophenone, thio-**

The particle **thioacetyl-** is used to designate the group $CH_3CS—$ and its use is similar to that of the particle **acetyl-** (see paragraph 76). The heading corresponding to **Ketone** is **Thione;** and it is used as described in paragraph 75; *e.g.:*



Thione, cyclohexyl 3-pyridyl

The particle corresponding to **oxo-** is **thioxo-;** *e.g.:*



Cyclohexanecarboxylic acid, 5-methyl-2-thioxo-, amide, *N*-**methyl-**

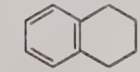
79. **Ketenes.** According to IUC rule 28.

80. **Azines.** See paragraph 109.

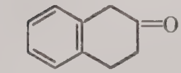
81. **Imines.** See paragraph 99.

82. **Oximes.** See paragraph 72.

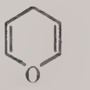
83. **Cyclic ketones and thiones.** When a cyclic system whose leading function is ketone or thione originally had two hydrogens in the site where O= or S= are attached, the compound gets the name of the parent compound with the ending **-one** or **-thione** *e.g.:*



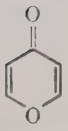
Tetralin



2-Tetralone

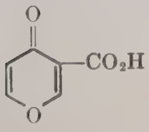


Pyran



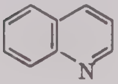
4-Pyrone

The ring system so obtained (including oxo- or thioxo- functions) may be used as a new ring system for the naming of compounds containing higher order functions (see paragraph 21); *e.g.:*

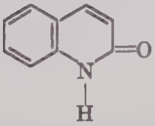


4-Pyrone-3-carboxylic acid

If the compound originally had only one hydrogen at the site of the ketonic function, the particles **oxo-** or **thioxo-** together with **dihydro-, tetrahydro-,** etc. are used; *e.g.:*

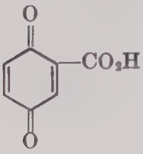


Quinoline



Quinoline, 1,2-dihydro-2-oxo-

84. **Quinones.** IUC rule 46 is followed. The quinone ring system may be used as a basis for the naming of compounds containing higher order functions.

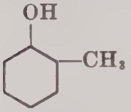


1,4-Benzoquinone-2-carboxylic acid

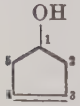
ALCOHOLS

85. **Aliphatic alcohols** appear under their Geneva names (IUC rule 20).

86. **Monocyclic aliphatic alcohols** appear under their Geneva names (IUC rule 20); *e.g.:*

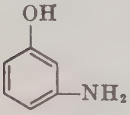


Cyclohexanol, 2-methyl-

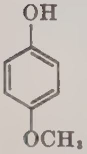


3-Cyclopenten-1-ol

87. **Heterocyclic and aromatic alcohols** (phenols). The name **Phenol** is used for C_6H_5OH and ring substituted derivatives with **no carbon** attached to the ring and no other hydroxyl group or higher order of precedence functions; *e.g.:*

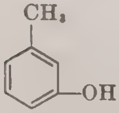


Phenol, 3-amino-

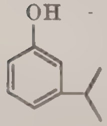


Phenol, 4-methoxy-

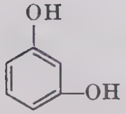
Otherwise the compound appears under benzene, toluene or elsewhere; *e.g.:*



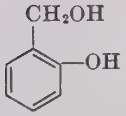
Toluene, 3-hydroxy-



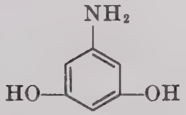
Benzene, 1-hydroxy-3-isopropyl-



Benzene, 1,3-dihydroxy-
(cross-reference under **Resorcinol**)

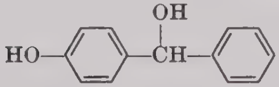


Toluene, *a*,2-dihydroxy-

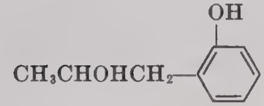


Benzene, 1-amino-, 3,5-dihydroxy-

Alcohols precede phenols in order; *e.g.:*

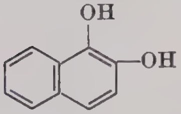


Methanol, (4-hydroxyphenyl)phenyl-

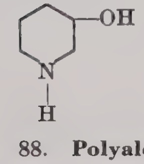


2-Propanol, 1(2-hydroxyphenyl)-

Exception: **Toluene, *a*-hydroxy-,** *not* **Methanol, phenyl-**
Other aromatic and heterocyclic phenols or alcohols will be named considering the hydroxyl group as an ordinary substituent; *e.g.:*



Naphthalene, 1,2-dihydroxy-



Piperidine, 3-hydroxy-

88. **Polyalcohols** such as **glycerol, erythrol,** etc. appear under their trivial names. Exception: **1,2-ethanediol.**

89. **Sugars** appear under their trivial names.

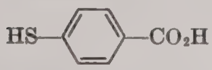
90. **Esters of complicated alcohols.** See paragraph 58.

91. **Hemiacetals and hydrates of aldehydes and ketones.** See paragraph 68.

92. The **carbinol** nomenclature for alcohols **is not used.**

93. **Thiols.** Aliphatic thiols follows IUC rule 22. Aromatic and heterocyclic thiols and molecules containing higher order functions together with the SH group will be named using the particle **mercapto.** Thiol is lower than alcohol but higher than amine in the order of precedence; *e.g.:*

CH_3CH_2SH **Ethanethiol**



Benzoic acid, 4-mercapto-

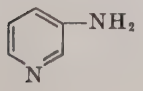
$HSCH_2CH_2OH$ **Ethanol, 2-mercapto-**

94. **Hydroperoxides.** See paragraph 112.

AMINES AND IMINES

95. The amine function is generally considered as an ordinary substituent (like **chloro-, nitro-,** etc.) *e.g.:*

$CH_3CH_2NH_2$ **Ethane, amino-**



Pyridine, 3-amino-

96. The name **aniline** is used for the compound $C_6H_5NH_2$ and as a parent compound for its derivatives unless a carbon atom is attached to the benzene ring or a function of rank higher than amino is present in the molecule; *e.g.:*

	**Aniline, 4-nitro-**
	**Phenol, 4-amino-**
	**Benzene, 1-diallylamino-4-ethyl-**
	**Acetic acid,** amide, *N*-phenyl- (cross reference under **Acetanilide**)
	**Biphenyl, 4(ethylmethylamino)-**

97. A list of names beginning with the word *Amine* appears in the Table; sometimes a cross-reference is given to the preferred name based on the largest radical present. If the choice is between a saturated and an unsaturated radical of the same number of carbon atoms, the unsaturated one is preferred. Regarding this nomenclature see paragraph 25.

$NH(CH_2C_6H_5)_2$	**Amine, dibenzyl-**
 $C_2H_5—N(C_6H_5)—CH_3$	**Amine, ethyl methyl phenyl,** *see* **Aniline, *N*-ethyl-*N*-methyl-**
	**Naphthalene, 2(phenylamino)-,** *see* **Amine, 2-naphthyl phenyl**
	**Amine, 2-naphthyl phenyl, 1,4′-dichloro-** (see paragraph 25)

98. **Hydroxylamine derivatives.** See paragraph 111.

99. **Imines.** The particle **imino-** is used for the group NH= when it is attached to a single carbon atom; *e.g.:*

$CH_3CH{=}NH$	**Ethane, imino-**

In some instances when the *imine* group comes in place of the oxygen of a keto-group the word imine appears after the name of the ketone; *e.g.:*

	**1,4-Benzoquinone, 2-chloro,** 4-imine

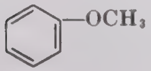
(This is similar to the usage in the case of oximes, see paragraph 72.)

ETHERS

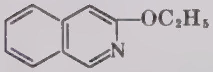
100. Simple and complex monoethers are found under the name **Ether** followed by the two radicals (without substituents) attached to the oxygen in alphabetical order and finally followed by the substituents in the skeleton of the ether (see paragraph 25); *e.g.:*

CH_3OCH_3	**Ether, dimethyl**
$BrCH_2OCH_2Br$	**Ether, dimethyl, 1,1′-dibromo-**
$(C_6H_5)_2CHOCH_3$	**Ether, (diphenylmethyl) methyl**
$C_6H_5CH_2OC_6H_5$	**Ether, benzyl phenyl**
$HC\vdots COC_6H_5$	**Ether, ethynyl phenyl**

101. Alkoxy derivatives of benzene (linear, saturated and with less than 6 carbons) and alkoxy derivatives of polycyclic or heterocyclic hydrocarbons appear under the cyclic hydrocarbon as a parent compound; *e.g.:*



Benzene, methoxy
(cross-reference under **Anisole**)



Isoquinoline, 3-ethoxy-

102. **Epoxy compounds.** Follow IUC rule 24, but cyclic ethers such as **furan, dioxan, dioxolan,** etc. are designated by their heterocyclic system name.

103. **Polyethers.** Some appear under their trivial names. Ethers of polyalcohols sometimes appear after the name of the corresponding alcohol.

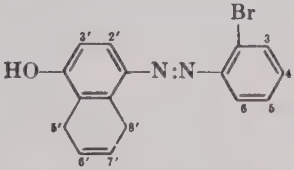
104. **Peroxides.** See paragraph 112.

105. **Thioethers.** See paragraph 114.

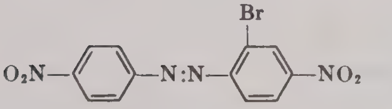
106. **Orthoesters.** See paragraph 47.

MISCELLANEOUS FUNCTIONS

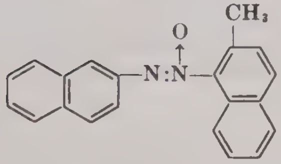
107. **Azo and azoxy compounds. Azo** and **Azoxy** are the headings for these compounds. After the word **azo** or **azoxy** comes the names of the hydrocarbon (if symmetrical) or hydrocarbons (if unsymmetrical) attached to the azo or azoxy group in alphabetical order; places of substitution are given with unprimed numbers for the first hydrocarbon and primed numbers for the second hydrocarbon (see paragraph 25); *e.g.:*



Azo, benzene 1-naphthalene, 2-bromo$_2$, 4′-hydroxy-

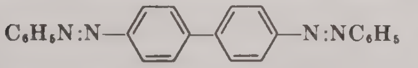


Azobenzene, 2-bromo-4,4′-dinitro-



1,2′-Azoxynaphthalene, 4′-methoxy-2-methyl-

In the case of **azoxy** no attempt is made to distinguish between the nitrogen atoms.
Some of the azo compounds are cross-referred to other parent compounds (see paragraph 48).
Some multiple azo compounds are named by derivation from the most highly substituted nucleus; *e.g.:*

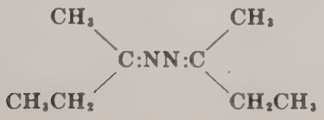


Biphenyl, 4,4′-bis(phenylazo)-

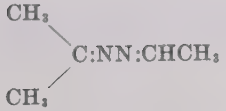
108. **Azides.** Azides of acids according to paragraph 54.
For other azides the particle **triazo-** is used (see paragraph 31); *e.g.:*

$CH_3CH_2N_3$ **Ethane, triazo-**

109. **Azines.** Appear under the name of the corresponding aldehyde or ketone if they are symmetrical; if not, under two headings with cross references; *e.g.:*



2-Butanone, azine



$(CH_3)_2C{:}NN{:}CHCH_3$

2-Propanone, azine with acetaldehyde

see **Acetaldehyde,** azine with 2-propanone

110. **Hydrazine derivatives.** Monoacyl derivatives of hydrazine are entered under the name of the acid followed by the word hydrazide; *e.g.:*

$CH_3CONHNH_2$	**Acetic acid,** hydrazine

Diacyl hydrazines appear under **Hydrazine,** *e.g.:*

$CH_3CO\underset{1}{N}H\underset{2}{N}HCOC_6H_5$	**Hydrazine, 1-acetyl-2-benzoyl-**

When a function of higher order of precedence (amino or higher) is also present, it may be convenient to use the particle **hydrazino-;** *e.g.:*

$NH_2NHCH_2CH_2CN$	**Propanoic acid, 3-hydrazino,** nitrile
$\underset{1}{N}H_2\underset{2}{N}H\underset{3}{C}O\underset{4}{N}H_2$	is **Semicarbazide,** with derivatives under this name, but semicarbazones appear under the corresponding ketone or aldehyde.
$\underset{1}{N}H_2\underset{2}{C}O\underset{3}{N}H\underset{4}{N}H\underset{5}{C}O\underset{6}{N}H_2$	is **Biurea,** with all its derivatives appearing under this name.

111. **Hydroxylamine derivatives. Hydroxylamino-** is used for HONH—, and **aminooxy** for NH_2O—. Names of *N*-acyl derivatives of hydroxylamine are derived from that of the corresponding amide; *e.g.:*

$CH_3CONHOH$	**Acetic acid,** amide, *N*-hydroxy-

Oximes are explained in paragraph 72.

112. **Peroxides and hydroperoxides.** Peroxides are listed under **Peroxide** and hydroperoxides are listed under **Hydroperoxide;** *e.g.:*

C_2H_5OOH	**Hydroperoxide, ethyl**
$C_6H_5CH_2OOCH_2C_6H_5$	**Peroxide, dibenzyl**
$C_6H_5OOCH_3$	**Peroxide, methyl phenyl**

113. **Miscellaneous Phosphorus, Arsenic and Antimony Compounds.** IUC rule 34 is followed.

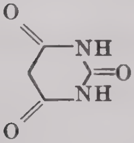
114. **Sulfides, disulfides, trisulfides sulfoxides and sulfones** follow rules identical to those of **ethers** see (paragraphs 100, 101), using an appropriate word or particle, as in the following examples:

CH_3OCH_3	**Ether, dimethyl**
CH_3SCH_3	**Sulfide,** ,,
CH_3SSCH_3	**Disulfide,** ,,
CH_3SSSCH_3	**Trisulfide,** ,,
$CH_3S(O)CH_3$	**Sulfoxide,** ,,
$CH_3S(O_2)CH_3$	**Sulfone,** ,,
$CH_3OC_2H_5$	**Ether, ethyl methyl**
$CH_3SC_2H_5$	**Sulfide,** ,, ,,
$CH_3SSC_2H_5$	**Disulfide,** ,, ,,
$CH_3SSSC_2H_5$	**Trisulfide,** ,, ,,
$CH_3S(O)C_2H_5$	**Sulfoxide,** ,, ,,
$CH_3S(O_2)C_2H_5$	**Sulfone,** ,, ,,
$C_6H_5OCH_3$	**Benzene, methoxy-**

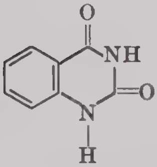
$C_6H_5SCH_3$	**Benzene, methylthio-**
$C_6H_5SSCH_3$	,, **methyldithio**
$C_6H_5SSSCH_3$	,, **methyltrithio-**
$C_6H_5S(O)CH_3$	,, **methylsulfinyl-**
$C_6H_5S(O_2)CH_3$	,, **methylsulfonyl-**

115. **Urea derivatives.** According to IUC rule 36.

Cyclic urea derivatives are named according to their ring system or trivial names:

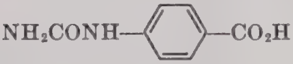


Barbituric acid



Quinazoline, 2,4-dioxo-1,2,3,4-tetrahydro-

The ureido function follows in order of precedence after the onium and the acid functions. The particle **ureido-** is used for the group $NH_2CONH—$ and **thioureido-** for $NH_2CSNH—$; *e.g.:*



Benzoic acid, 4-ureido-

nd	needles
o-	ortho-
oct	octahedral
og	orange[3]
oos	ordinary organic solvents
or	or
ord	ordinary
org	organic
orh	orthorhombic
os	organic solvents
p-	para-
pa	pale
par	partial
peth	petroleum ether
pk	pink[3]
Ph	phenyl
pl	plates
pr	prisms
Pr	propyl
Prak	J. Prak. Chem.
purp	purple[3]
pw	powder
Py	pyrimidene
pym	pyramids
rac	racemic
rect	rectangular
red	red
res	resinous
rh	rhombic
rhd	rhombohedral
s	soluble
s	secondary[7]
sc	scales
sec	secondary[7]
sf	softens
sh	shoulder
silv	silvery
sl	slightly (δ)
so	solid
sol	solution
solv	solvent
sph	sphenoidal
st	stable
sub	sublimes
suc	supercooled
sulf	sulfuric acid
sym	symmetrical
syr	syrup
t	tertiary[7]
ta	tablets
tcl	triclinic
tert	tertiary[7]
Tet	Tetrahedron
tetr	tetragonal
THF	tetrahydrofuran
to	toluene
tr	transparent
trg	trigonal
undil	undiluted
uns	unsymmetrical
unst	unstable
v	very
vac	vacuum
var	variable
vap	vapor
vic	vicinal
visc	viscous
volat	volatile or volatilises
vt	violet[3]
w	water
wh	white[3]
wr	warm
wx	waxy
ye	yellow[3]
xyl	xylene

---

[1] For I.U.C. rules of nomenclature see General Index.

[2] Generally means ethyl alcohol.

[3] The abbreviation of a color ending in "sh" is to be read as ending with the suffix "-ish," *e.g.*, grsh means greenish.

[4] *D*, *L* generally mean configuration and *d*, *l* generally mean optical rotation, but there are many examples in the chemical literature for which the meaning of these symbols is ambiguous and/or interchangeable.

[5] Generally means diethyl ether.

[6] *N* indicates a position in the molecule.

[7] *s* and *sec*, or *t* and *tert*, are used as convenient.
